Minnesota local government road networks: county-area profiles.

October 9, 2002

This report details local government road networks and spending in each of the state's 87 county-areas. It combines four road-related data sets to create a profile of county, city, and town network use and financing. While county governments have countywide responsibilities, each county may have numerous cities or towns. For purposes of these profiles all cities and all towns within a county-area are combined. Described below are the source and definition for each table element in the profile.

(Census) At the top of each table is the countywide **population** in 1980, 1990, and 2000. This data is from U.S. Census available from the Minnesota State Demographic Center. (<http://www.mnplan.state.mn.us/demography/Census2000.html>). The change in population (**% chg**) between decades indicates the growth, stability, or decline in the county. Also from the State Demographic Center is the **area in square miles** measuring the land area less any water surface. **Population density** is the average (2000) census population spread evenly over the land area. Finally, total road miles and vehicle miles traveled for all local governments in the county-area are summarized.

(MnDOT) The Minnesota Department of Transportation, Office of Transportation Data and Analysis provided information on the physical road and system use in 2000. In this analysis roads are classified into four **road types**: principal and minor arterials, collectors, and local roads. Not every local government road network has all four classes, but for each road type length and vehicle use are reported. **Miles** of road represents the centerline distance or length of a road network. Road use is measured by the vehicle miles traveled annually (**VMT/year**). Since it is not possible to measure the traffic on every road every day, these values are estimated from road surveys and other engineering techniques. To compare road use across systems of different size one useful transformation is the average annual daily traffic (**ADT**). The average daily traffic is the level of vehicle travel – coming and going in both directions – on a typical network mile during an average day. (A zero reading in the road miles column indicates a length of less than one mile.)

(OSA) Local governments report a variety of road finance information each year to the Office of the State Auditor, as part of their general reporting of revenues, expenditures, and debt. (<http://www.osa.state.mn.us>). It is assumed that local governments accurately account for road spending, aid, and transfers in the proper (road-related) categories of their reports. Total **road expenditures** are the sum of current and capital spending by local governments on area roads. While the definition of current spending can vary between levels of government it generally refers to the cost of road maintenance, engineering/administrative costs, snow removal, and street lighting. Capital spending, by contrast, accounts for longer-term investments in roads and road equipment.

The share of total spending reported as current expenditures (**maintenance**) demonstrates the “lumpy” nature of road spending over time.

State road aid is the value of categorical road aids, more specifically the County State Aid Highway funding and Municipal State Aid Street funding for cities over 5,000 in population. Towns and small cities get state aid as well, but a relatively small amount. Counties, cities, and towns also report **other transfers** for road funding. For counties the source is Federal Highway Planning and Construction grants. Cities report aid from the county, service contracts, and gravel tax receipts, which are dedicated to road purposes. Towns report aid from the county. Total road spending minus the value of state aid and other transfers is the **local effort** tax needed to pay for area roads. The percent of total spending not covered by state aid or other transfers is the **local share**. *Note: OSA data is missing for towns in Koochiching and Lake of the Woods counties.*

(DPS) The makeup of road users is an important factor in road costs, and one proxy for use is the number of light and heavy vehicles registered in a county. This analysis uses 1998 data provided by the Minnesota Department of Public Safety, Division of Driver and Vehicle Services (<http://www.dps.state.mn.us>). **Light vehicles** include all passenger cars, vans, and pickup trucks, while **heavy vehicles** include buses, farm and commercial trucks. Semi and other commercial trailers, plus boat, utility, or recreational trailers, motorcycles and other “vehicles”, round out **all registrations** in the county. The **taxes paid** are the combined total receipts from the motor vehicle registration tax.
